

LeadOS MVP Product Scope and User Flow Document

1. Product Overview

LeadOS is an enterprise SaaS platform for AI assisted lead conversion.

For the hackathon MVP, we will configure LeadOS for a **dummy financial partner program**, not directly for Rupeezy branding. The dummy client will represent the same use case: converting partner leads such as financial advisors, MFDs, insurance agents, influencers, and referrers into qualified opportunities.

The goal is to build a working product that proves this flow:

The product is not just a chatbot and not just a voice agent. It is a lead conversion system that helps sales teams respond faster, qualify better, and hand over only useful leads to humans.

2. What the MVP Must Prove

The MVP must prove the core requirements of the theme:

1. The AI can engage a lead through voice or chat.
2. The conversation can happen in English, Hindi, or Hinglish.
3. The AI can follow a structured sales conversation.
4. The AI can handle the five major objections naturally.
5. The system can score the lead as Hot, Warm, or Cold.
6. The system can generate a post conversation summary.
7. Hot leads are handed to an RM with full context.
8. Warm leads get a WhatsApp follow-up path.
9. Cold leads are closed or kept low priority.
10. Admins can see the funnel, lead list, scores, summaries, transcripts, and analytics.

Everything else is secondary.

3. Product Surfaces

The MVP has four visible product surfaces:

1. LeadOS SaaS Website
2. Dummy Client Website
3. Admin Portal
4. RM Portal

And one backend system powering everything:

5. Backend + AI + Workflow System

4. LeadOS SaaS Website

This is the public website for the LeadOS product.

Its purpose is to show judges that this is an enterprise SaaS platform, not just a hackathon script.

Main purpose

The SaaS website explains:

- What LeadOS is
- What problem it solves
- How the product works
- Why AI voice/chat helps lead conversion
- How the demo can be accessed

Required sections

The website should have:

- Hero section
- Problem section
- How it works section
- Feature section
- Demo CTA section
- Architecture preview section

- Login buttons for Admin and RM
- Link to Dummy Client Website

Suggested hero message

Convert raw leads into qualified sales opportunities using multilingual AI voice and chat.

Suggested flow shown on site

Capture Lead → AI Conversation → Score → Route → RM Handoff

Important note

The SaaS website should look polished, but it should not consume too much build time. It is mainly for product framing and demo navigation.

5. Dummy Client Website

This is the fake client site where leads enter the system.

We should not use Rupeezy branding directly. Use a fictional client such as:

FinPartner Pro

or:

Demo Finance Partner Program

Main purpose

The dummy website simulates how a real client would capture leads from a campaign or landing page.

A visitor fills a form, selects a language, gives consent, and starts chat or requests a call. That lead then enters the backend pipeline.

Required sections

The dummy website should have:

- Simple landing section
- Partner program explanation
- Lead form
- Preferred language selector
- Preferred channel selector
- WhatsApp consent checkbox
- Start chat button
- Request AI call button
- Basic confirmation state

Lead form fields

The form should collect:

Name
Phone
Email optional
Preferred language
Role
City
Approx network size optional
Preferred channel: Chat / Voice
WhatsApp consent

Lead form flow

User visits dummy website → fills form → selects language → chooses chat or voice → lead created in backend → status becomes New / F

Chat entry

If the lead chooses chat:

Lead submits form → Chat opens → AI starts in selected language → Conversation happens → Transcript saved → Scoring runs

Voice entry

If the lead chooses voice:

Lead submits form → Request Call selected → Backend/Vapi starts or simulates call → Transcript captured → Scoring runs

For the MVP, the chat path should be very reliable because it is easier to demonstrate end to end. The voice path should also exist because the theme is about voice, but it should not block the full pipeline.

6. Admin Portal

The Admin Portal is for the client admin. It shows visibility and control over the entire lead conversion system.

Main purpose

Admins need to see:

- How many leads came in
- How many were contacted
- How many became Hot, Warm, or Cold
- Which language leads used
- Which objections were common
- Which RMs are handling leads
- What summaries and transcripts were generated
- What follow-ups are pending

Admin dashboard

The dashboard should show:

Total leads
Conversation completed leads
Hot / Warm / Cold split
Pending follow-ups
Converted count
Language distribution
Objection trends
Campaign performance
RM performance
Recent conversations

Lead management

Admin should be able to:

- View all leads
- Search leads
- Filter by status
- Filter by classification
- Filter by language
- Filter by campaign
- Open lead detail page
- Manually create a lead if needed
- Assign or reassign RM if needed

Lead detail page for admin

Admin should see:

- Lead profile
- Current status
- Hot/Warm/Cold classification
- Score and score reason
- Conversation summary
- Full transcript
- Objections raised
- Recommended next action

- Assigned RM
- Follow-up status
- WhatsApp follow-up link if generated

Campaign view

For MVP, one default campaign is enough.

Example:

```
Demo Partner Campaign
```

If time allows, admin can create campaigns and view campaign wise performance.

Knowledge base view

Admin should be able to see what documents are used by the AI.

For MVP, this can be simple:

- Script document
- FAQ document
- Onboarding information
- Objection handling guide

We do not need full document management in the MVP. Static seeded docs are enough. Upload can be added only if core flow is complete.

Admin data chatbot

The admin chatbot helps ask questions over lead and campaign data.

Example questions:

```
Show Hot Hindi leads.
Which objection is most common?
Which campaign generated most Hot leads?
Show Warm leads needing follow-up.
```

For MVP, the chatbot can support limited predefined query patterns. It does not need unrestricted SQL or complex analytics.

7. RM Portal

The RM Portal is the sales workspace. It is one of the most important product surfaces because the theme clearly says Hot leads must be handed off to a human RM with full conversation context.

Main purpose

The RM portal helps sales users quickly understand and act on qualified leads.

The RM should not receive only a name and phone number. They should receive the full story of the AI interaction.

RM dashboard

The RM dashboard should show:

```
Assigned leads
Hot lead queue
Follow-ups due
Recent AI handoffs
Converted leads
In-app notifications
```

Hot lead queue

The Hot Lead Queue should list all Hot leads assigned to the RM.

Each lead card should show:

Lead name
Score
Language
Main objection
Recommended next action
Current status
Time since AI conversation

RM lead detail page

This is the most important RM screen.

It should include:

Lead profile

Name
Phone
Email optional
Language
Role
City
Campaign
Assigned RM
Current status

AI score card

Final score
Classification: Hot / Warm / Cold
Score reason
Readiness score
Engagement score
Fit score
Positive signals
Negative signals

AI summary

The RM should see:

What was discussed
What the lead cared about
Main concern
Next action

Objection section

The RM should see:

Objection type
Lead statement
AI response summary
Resolution status

Resolution status can be:

Resolved
Partially resolved
Unresolved

This does not need to be stored live during chat. It can be extracted by the scoring LLM after the conversation.

Transcript section

The RM should see the full chat or voice transcript.

Recommended next action

Examples:

```
Call today before 6 PM.
Send onboarding link.
Follow up on trust concern.
Ask about network size.
```

Suggested RM opening line

Example:

```
Hi Amit, I saw you spoke with our AI assistant about daily payouts and brokerage share. I can quickly help you compare this with you
```

RM actions

RM should be able to:

- Mark converted
- Mark not interested
- Reschedule follow-up
- Take over lead manually
- Cancel AI follow-up
- Mark WhatsApp follow-up sent
- Correct AI score
- Add RM note

RM notifications

For MVP, alerts should be inside the RM portal.

Examples:

```
New Hot lead assigned
Follow-up due
AI follow-up awaiting decision
```

WhatsApp alerts to RM are not needed in MVP.

8. Backend and AI Workflow System

The backend powers the entire product.

It handles:

- Authentication
- Role access
- Lead creation
- Lead storage
- Campaign mapping
- Conversation storage
- AI chat
- Vapi voice webhooks
- LangGraph conversation flow
- RAG retrieval
- Memory
- Scoring
- Summary generation
- RM handoff
- WhatsApp link generation
- Notifications
- Analytics APIs

Core backend flow

```
Lead created → Pending Contact → AI chat/voice conversation → Conversation Completed → Scoring LLM runs → Lead classified Hot/Warm/C
```

Chat flow

Lead starts chat → Backend loads lead context → LangGraph starts flow → AI greets in selected language → AI pitches benefits → AI handles objections → AI schedules follow-up

Voice flow

Lead ready for call → Vapi starts voice session → Vapi sends transcript webhook → Backend updates LangGraph state → Context loaded → AI greets → AI pitches → AI handles objections → AI schedules follow-up

Vapi handles the voice layer. LangGraph controls the conversation logic.

LangGraph conversation stages

Greeting → Language Confirmation → Hook → Pitch → Discovery → Objection Handling → Qualification → Close

RAG behavior

RAG is used for factual support.

Knowledge sources:

```
Script
FAQ
Onboarding details
Objection guide
Support information
```

The five core objection strategies should be in system context, because they are core sales behavior. RAG should support facts, not decide the sales strategy.

Memory behavior

Memory should store:

```
Preferred language
Previous objection
Callback time
WhatsApp consent
Previous score
Latest summary
RM note optional
```

If a lead says "Call me Monday," future interaction should remember that.

Tool actions

Only use real tools for actions that change state or trigger workflow.

MVP tools:

```
Update language
Save callback time
Save WhatsApp consent
Update lead status
Create RM task
Generate WhatsApp follow-up link
Assign RM
```

Do not make "save objection" a live tool in MVP. Objections can be extracted after conversation during scoring.

9. Lead Statutes and Classifications

Keep statutes simple.

Lead Status

New
Pending Contact
Conversation Completed
Assigned to RM
Follow Up Scheduled
Converted
Closed

AI Classification

Hot
Warm
Cold

Outcome

Optional for MVP:

Converted
Not Interested
No Response
Invalid Lead

Recommended routing

Hot → Assigned to RM
Warm → Follow Up Scheduled
Cold → Closed

10. Objection Handling

The theme requires five objection types.

Already with another broker
Not enough contacts
Client support concern
Trust concern
Think later / call later

Objection flow

Lead raises objection → Agent detects type → Agent checks context → Agent responds using approved policy → Agent asks next step → Score

Objection storage

For MVP, store objections inside scoring output JSON.

Example:

Type: Existing Broker
Lead statement: I already work with another broker
Resolution: Resolved

Later, this can move to a separate objections table.

11. Scoring and Qualification

The scoring system classifies each lead as Hot, Warm, or Cold.

Scoring dimensions

Readiness: 40
Interest and Engagement: 35
Fit and Network: 25

Signals

The scoring LLM should extract:

Language
Role
Network size
Current broker status
Objection type
Objection resolution
Questions asked
Callback intent
WhatsApp consent
Buying intent
Trust concern
Recommended next action

Classification rules

Hot: strong interest and next step intent
Warm: interested but needs follow-up
Cold: low intent, low fit, or not interested

Suggested thresholds:

Hot: 70+
Warm: 40–69
Cold: below 40

Explainability

Every score must show:

Final score
Classification
Reason
Positive signals
Negative signals
Recommended next action

This is required for RM trust.

12. Handoff Flow

Hot leads must be handed to RM with full context.

Lead classified Hot → RM task created → RM portal alert → Lead appears in Hot Queue → RM opens handoff card → RM follows up

RM handoff card includes:

Lead profile
Score
Reason
Summary
Transcript
Objections
Resolution status
Key statements
Suggested opening line
Recommended next action
WhatsApp consent

13. Warm Lead WhatsApp Follow-up

The theme says Warm leads receive a WhatsApp follow-up link.

For MVP, use automated **wa.me link generation** instead of full WhatsApp API.

Warm lead flow

Lead classified Warm → System generates WhatsApp message → System generates wa.me link → Follow-up record saved → RM/Admin sees Oper

This is simple, demoable, and avoids Meta Business verification delays.

Follow-up UI

Show:

Channel: WhatsApp
Status: Ready
Message preview
Open WhatsApp button
Mark Sent button

Production path

In production, the same n8n step can connect to:

Meta WhatsApp Cloud API
Twilio
WATI

14. Cold Lead Flow

Cold leads should not waste RM time.

Lead classified Cold → Status becomes Closed → Summary saved → No RM task created

If the lead clearly says not interested, the reason should be visible in lead detail.

15. RM Control Flow

RM should have control before automated follow-up.

Follow Up Due → RM Alert → Proceed: AI Calls Lead | Reschedule: Callback Updated | Cancel: Outreach Stopped | Takeover: RM Handles M

This prevents duplicate outreach and gives human control.

16. Analytics

The dashboard should show the conversion funnel and lead quality.

Required analytics

Total leads
Conversation completed leads
Hot count
Warm count
Cold count
Language distribution
Objection distribution
Follow-up scheduled count
Assigned to RM count
Converted count

Useful charts

Hot/Warm/Cold pie chart
Lead status funnel
Language bar chart
Objection bar chart
RM performance table
Recent conversation list

17. Data Chatbot

The data chatbot is a product differentiator, but it should stay simple.

Admin chatbot examples

Show Hot Hindi leads.
Which objection is most common?
Show Warm leads needing follow-up.
Show campaign performance.

RM chatbot examples

Summarize Amit.
Show my Hot leads.
Show my callbacks today.

For MVP, use safe predefined tools rather than unrestricted database querying.

18. WhatsApp, Email, and Notification Decision

Lead WhatsApp follow-up

Primary MVP approach:

Generate wa.me link and message preview

RM alerts

Primary MVP approach:

In-app RM portal notification

Optional fallback

If time allows:

Email notification through n8n

Do not spend core time on real WhatsApp API setup unless everything else is complete.

19. Feature Priority

Priority is based on theme requirements.

Priority 1: Core judging flow

```
Lead capture
AI chat
AI voice demo
Multilingual handling
Five objection handling
Transcript storage
Scoring
Summary
Hot/Warm/Cold routing
RM handoff with full context
Admin dashboard funnel
```

Priority 2: Strong product differentiation

```
RAG
Memory
WhatsApp wa.me follow-up
RM controls
Objection resolution status
Language analytics
Objection analytics
RM notifications
```

Priority 3: Polish

```
Data chatbot
Knowledge base UI
CSV upload
Campaign management
Scoring settings
RM feedback
Advanced dashboard charts
Email fallback
```

20. Final Demo Flow

The final demo should show:

```
Open SaaS website → Open dummy client website → Submit lead → Start AI chat or voice → Lead raises objection → AI handles it → Lead
```

This is the full product story.

21. MVP Success Criteria

The MVP is successful if we can show:

- A lead enters from the dummy website
- AI speaks or chats in the selected language
- AI handles at least one objection well
- Conversation transcript is saved
- Lead is scored with explanation
- Hot lead appears in RM portal with full context
- Warm lead gets a generated WhatsApp follow-up link
- Admin dashboard shows funnel metrics
- RM can act on the lead

That is enough to satisfy the theme and make the project feel like a real SaaS product.
